

Repository checklist for contributing a task to the Movement Imagery Ability (MIA) platform

Complete this checklist *after* the task has been reviewed as suitable in principle for the MIA platform. It confirms that the repository, documentation, output, and technical testing comply with fundamental standards of the MIA platform.

Optional features

A language-localization system and adaptable parameters are recommended but not required. If they are included, document how they work in the README.

Task and repository

Public repository URL *	Click or tap here to enter text.
-------------------------	----------------------------------

1. Repository and reuse

☐	The task is programmed in software that does not require a license (e.g., PsychoPy, OpenSesame).
☐	The repository is open-access (e.g., GitHub) and contains everything needed for task implementation: experiment file, conditions, stimuli, instructions, README file (see section “2. Documentation and output”) and other required materials.
☐	You have the right to share all included materials, and the repository contains no identifiable participant data.

2. Documentation and output

☐	The MIA README template is fully completed and added to the repository.
☐	The repository includes an example data file with expected output structure. If the task requires processing of raw data (which it likely does), provide an example script (e.g., in R, Python, or MATLAB) illustrating this processing.

3. Final test

☐	The task has been tested from start to finish and on different relevant setups (e.g., operating systems, browsers, devices, or software versions). Any known technical or compatibility limitations are documented in the README.
--------------------------	---

Ready to contribute? After successful completion, send this completed **repository checklist** (tick the boxes!) to the corresponding author of the MIA platform [✉](#).
