

Initial task fit check for contributing to the Movement Imagery Ability Task (MIAT) platform

What to submit for the initial review

Complete this short check *before* preparing a repository. It helps the MIAT team assess whether the task is within scope and can (in principle) be shared through the platform. A repository, README, and final technical testing are not required at this stage.

1. Task fit and evidence

☐	The task's target construct(s) are within the scope of the platform and stated clearly (e.g., maintenance, manipulation). The platform is intended for movement imagery ability tasks, not for general mental rotation, visuospatial abilities, or other related cognitive constructs.
☐	An accessible peer-reviewed article describes the task and the available evidence for its intended use (validity, reliability). The validation study was conducted in line with applicable ethical standards.

2. Feasibility of an open-access contribution

☐	The task can be provided in software that does not require a paid software license to open, adapt, and run it (e.g., PsychoPy or OpenSesame).
☐	I have the right to share all materials required to run the task.
☐	If the task receives preliminary acceptance for the MIAT platform, I am willing to... - prepare an open-access repository including the completed MIAT README template and a data preparation script. - complete the required technical testing. <i>The README requires information on (see README template) ...</i> - <i>Task purpose, movement imagery process, supporting evidence</i> - <i>Tested software/version, deployment mode, requirements, setup steps, and repository contents</i> - <i>Participant and trial workflow, including the approximate duration or block/session structure</i> - <i>Languages, adaptable settings, demographic questions</i> - <i>Raw output, main outcome or score calculation, variable descriptions, and data preparation</i> - <i>Last-updated date and a brief version history for changes that affect task use or output</i>

Ready for the initial review? After successful self-screening for initial fit of the task, send the completed **initial task fit checklist** (tick the boxes!) together with the completed **[task information form](#)** and the **peer-reviewed article** to the corresponding author of the MIAT platform [✉](#).

The MIAT team will assess task fit and evidence before asking you to prepare the repository.
